***** FIELD REPORTS *****

***** PROJECTS *****

John F's hobby is flying radio controlled electric planes and on occasion he makes a dumb mistake and crashes the plane. This one with the mangled nose was repaired in a couple of hours. Another sticking out of the ground was beyond repair.

Al B. has been busy of late putting a book nook together for the Chamber of Commerce.

This all because someone visited them to look at their Fokker DR1 model!

***** FACILITIES *****

Exhibit-1 shows what the table saw grill capture before it could get into the dust collector pipes. This was still a hindrance to be removed.

Exhibit-2 shows what made it into the dust collector pipes and bugged up the fan intake. If you have low suction this is a good place to start. The double gate assembly just wiggles off.

Exhibit-3. Al had trouble closing the table saw dust gate last week. This roll was found INSIDE the pipe?

*** FACILITIES ***

Doug J. Was busy this last week building a second drawer for the central bench. Someone had kindly dropped off a few guide rails and we already had a suitable box. The table top was cleared off, removed and turned upside down for the installation. The front panel support brackets can be installed **four** different ways! No doubt next time you see inside it will be full of goodies.

*** TOOLS ***

Power Plane. This made a nice job of planing a chamfer on a home project but then I tried to open it up to replace the cable. The two sides came off easy enough along with the front shoe, but that's about as far as I gotten. The final dust heap was likely worth the effort. There is a knob at the front which adjusts the shoe to set the cutting height. Best left at P(ark) when you put it away. I wrapped the cable.

*** MISCELLANEOUS ***

In an effort to reduce cost the management has asked me to look in to **AI**. Like plastic, it's everywhere. There are two items which were sourced from such. One is attached; you and I don't need to understand the software listing only to know it was created automatically from the question which I edited to the description. For maybe half my career I made a living spitting out this stuff. On military jobs there were people payed to write code to test your code, code to run test equipment, test procedures, and test reports; long before anything was allowed to fly.

"The Outreach Team of Men's Shed's Ontario continue their planning for visits to up to 20 communities throughout the summer. Meanwhile the president of Men's Sheds Canada, Robert Goluch, from Squamish B.C., made a presentation to a NORC (Naturally Occurring Retirement Communities) association in Kingston, Ontario. As a result we have learned that a group of Engineers at Queen's University have applied for a grant to start a Men's Shed there and one member of the NORC group from Ottawa is exploring the possibility of up to three more Sheds in Ottawa. One never knows where a door will open to expand the good that Men's Sheds do."

*** WEB ***

Maybe we aren't thinking this through:
